

Bachelor Thesis

Knowledge Refinement in Expressive Description Logics

Candidate Roland Bernard

Supervisors Oliver Kutz
 Nicolas Troquard

July 2023

Description Logics

- ▶ Family of logics used to represent knowledge
 - aiming for favorable trade-offs between complexity and expressivity
- ▶ Individuals, e.g., *roland oliver nicolas unibz blue*
Concepts, e.g., *Student Professor Person University Color*
Roles, e.g., *studiesAt supervisedBy hasColor*
- ▶ Complex concepts, e.g., $\neg \text{Person}$ $\text{Person} \sqcap \text{Student}$ $\exists \text{studiesAt.University}$
- ▶ Axioms, e.g., $\text{Student} \sqsubseteq \text{Person}$ $\text{Student}(\text{roland})$ $\text{studiesAt}(\text{roland}, \text{unibz})$

Knowledge Refinement in Description Logics

- ▶ Process of iteratively modifying and improving the ontology
- ▶ Using two refinement operators
 - specialization operator, e.g., *Student* is a specialization of *Person*
 - generalization operator, e.g., *Person* is a generalization of *Student*
- ▶ Using an axiom weakening operator
 - converts axioms such that they are less restrictive
 - using the refinement operators

Applications of Knowledge Refinement

Repairing ontologies, e.g.,

- making inconsistent ontologies consistent
- removing unintended consequences

Combination of conflicting knowledge

- also for computational concept combination

Machine learning

- learning axioms from data

Weakening in Expressive Description Logics

🎯 Extend axiom weakening to the description logic \mathcal{SROIQ}

! Simple roles can not be used in every context
→ using a non-simple role in some places is forbidden

! The graph formed by the role inclusions must match constraints
→ adding new role inclusions can violate them

🛡️ These problems have been prevented by ensuring that
→ all simple roles remain simple after refinement
→ only simple roles are used during the refinement

Implementation of Axiom Weakening

Implemented in Java using the OWL API

→ a library providing a uniform way of interfacing with reasoners

Using of-the-shelf reasoners for the Web Ontology Language

→ requires mapping between Web Ontology Language and *SROIQ*

Tests to ensure correct behavior of the implementation

→ manual tests of expected operator results

→ automatically generated tests asserting general properties and invariants

A Protégé Plugin supporting these Techniques

Protégé plugin for axiom weakening

- allow computing weakening for specific axioms
- enable automatic ontology repair

Automatic Repair:

Repair using **Weakening** Make ontology **Consistent**

Bad axiom **Sample one inconsistent set**

Reference ontology **Random maximal consistent set** ☐ Uncached covers

☐ Basic cache ☐ Strict NNF ☐ Strict ALC ☐ Strict SROIQ ☐ Strict simple roles

☐ Basic RIA weakening ☐ No role refinement ☐ Enhance reference ontology

Evaluating Axiom Weakening for Ontology Repair

Repaired once using axiom weakening and once using removal

→ the quality of the resulting repairs is compared

Deciding which repair is “better” is not well-defined

→ we want to retain as many consequences as possible

→ we focus only on subsumption between simple concepts

For comparing two repairs we define the IIC of \mathcal{O}_1 w.r.t \mathcal{O}_2

→ value close to 1 for when \mathcal{O}_1 is better

→ 0.5 if both repairs are equally “good”

→ value close to 0 for when \mathcal{O}_2 is better

Evaluation Results

Comparison between using axiom weakening and using removal

- significantly better for some ontologies
- in many cases only minor or no improvement

Outcomes of the Thesis

Extended the axiom weakening operator to *SROIQ*

→ and showed that the proposed approach maintains the necessary constraints

Developed a Protégé plugin for applying these techniques

→ allowing users to easily repair ontologies and weaken axioms

Evaluated the proposed approach on real-world ontologies

→ showing that axiom weakening can outperform removal

Future Outlook

Study the possibility of loosening the restriction

- refine with non-simple roles in some cases
- more permissive weakening of role inclusions

Study better ways of guiding the repair process

- using better heuristics, maybe domain specific
- using user input to guide the repairs

Find better measures for comparing the quality of repairs

Study other possible applications of axiom weakening
